

What are Linear M	odels?	
AVOVA 1A	Linear Regression	
	Logistic regression	
Before After Control Impact (BACI) Studies	Count regression	
Repeated measures	Randomised Control Trials (RCT's)	
Plus Many More!!

Simple Linear Model Continuous response and predictor

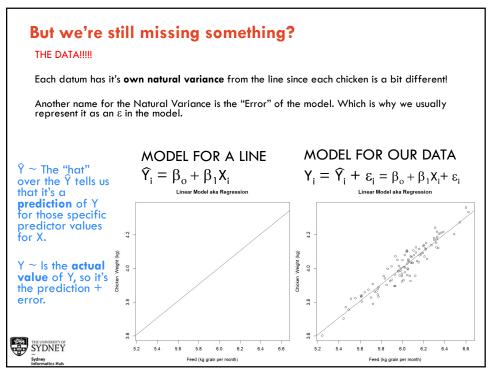

Workflow Suitable for:

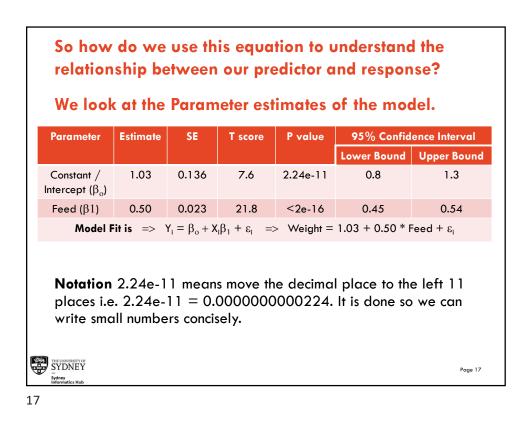

- Modelling continuous predictors (workflow shown is for 1 predictor, there are additional considerations when more than 1 e.g. multicollinearity, these are discussed in our Model Building workshop)
- Least Squares Regression
- Simple Linear Regression

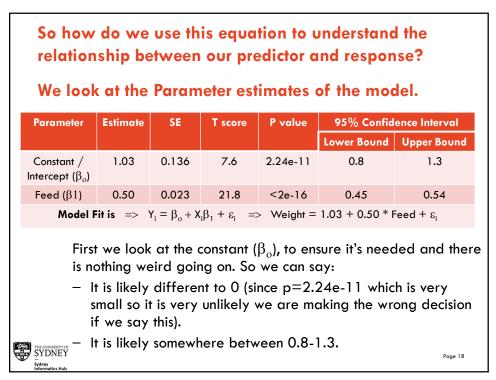

THE UNIVERSITY OF SYDNEY

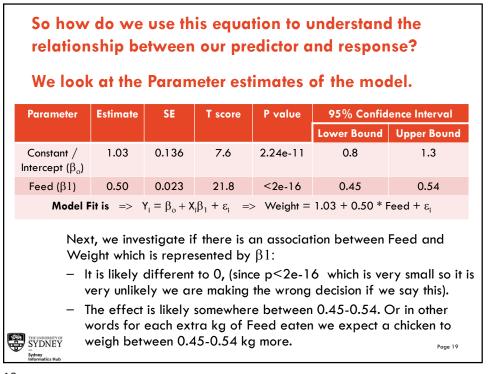

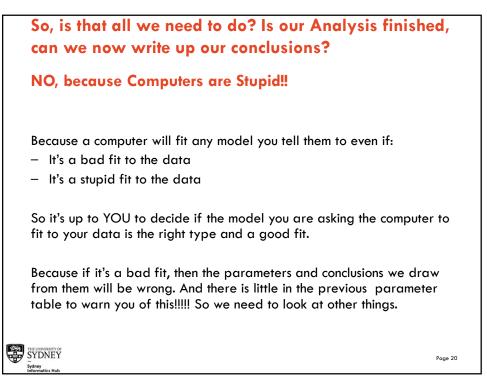

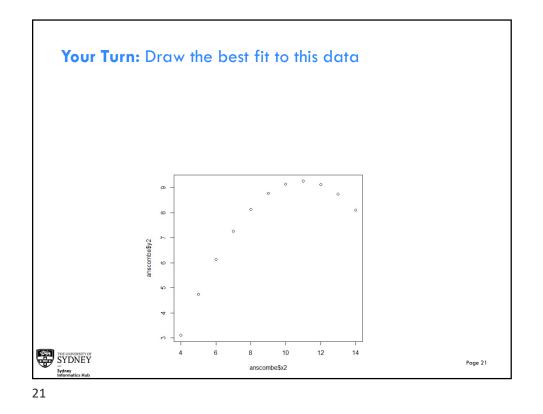

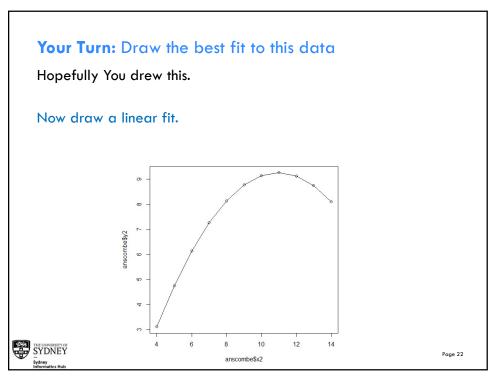

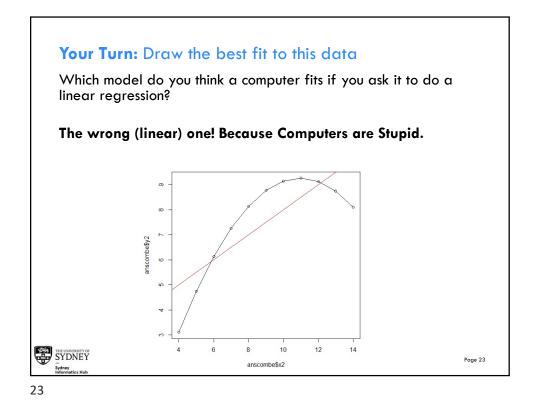

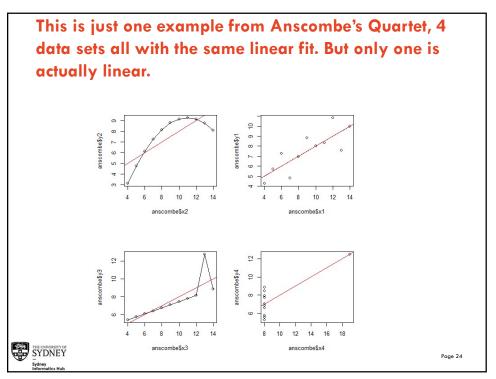

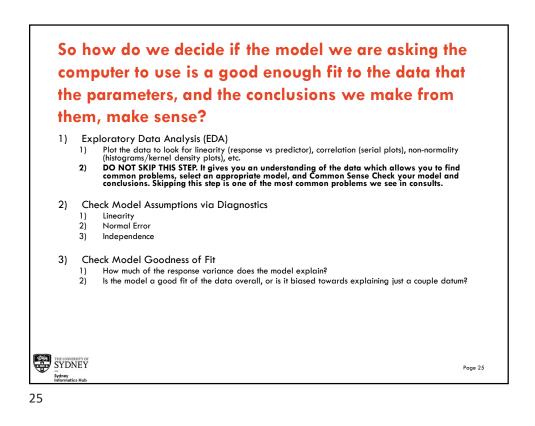

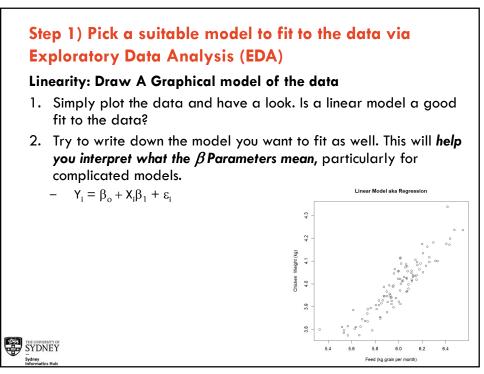

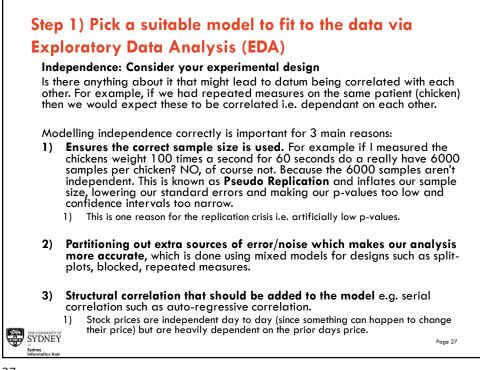

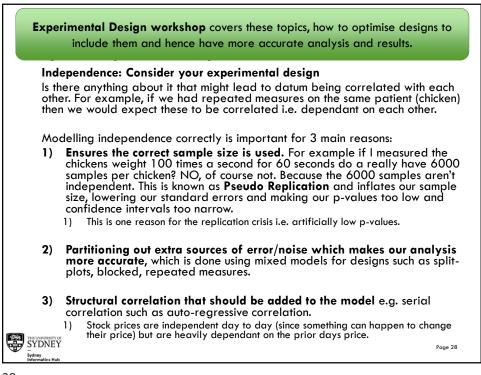

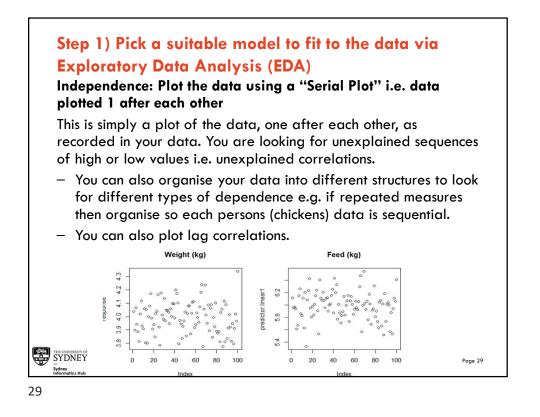

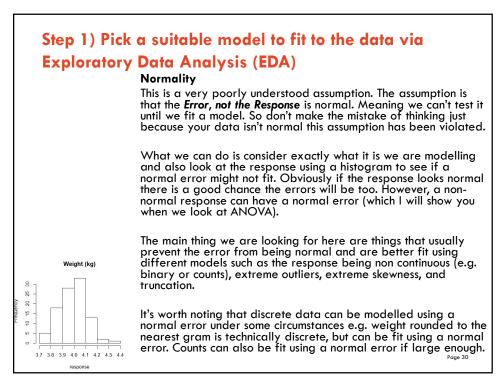

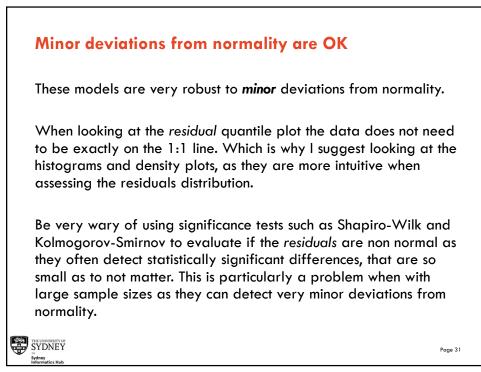

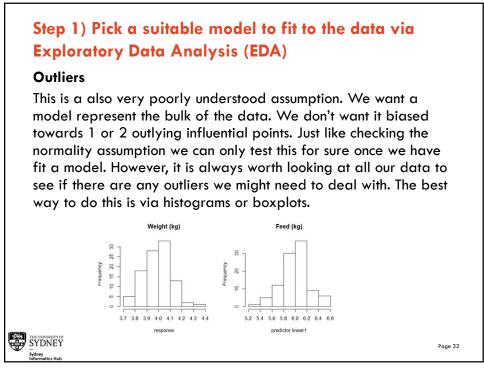

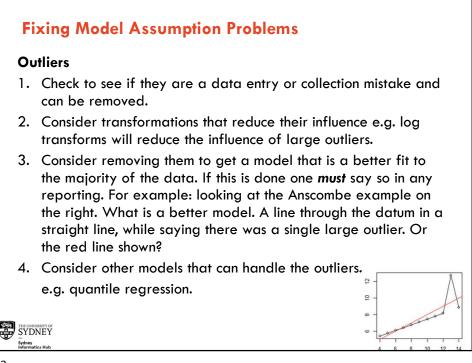

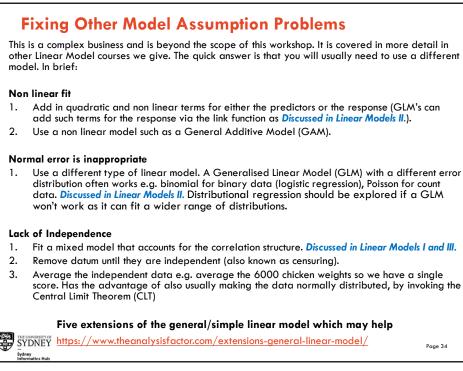

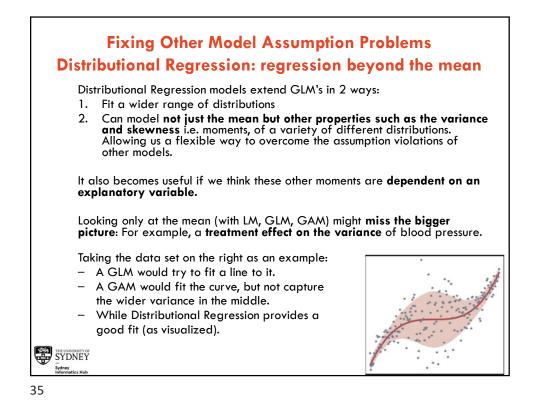

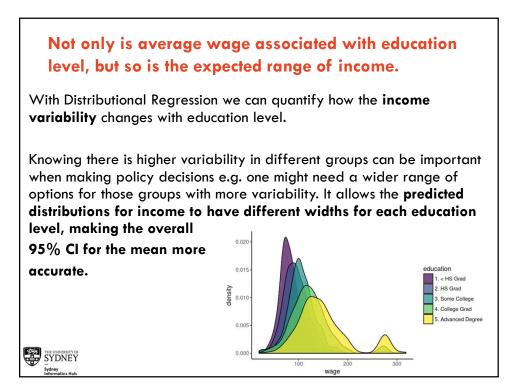

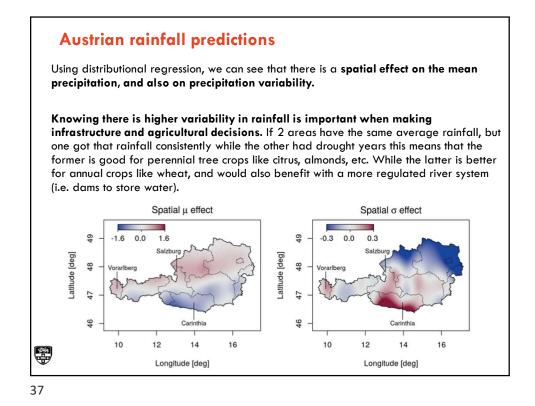

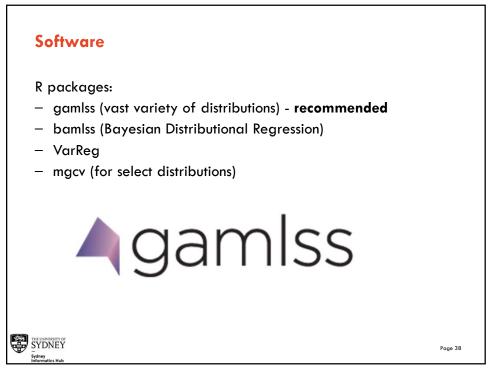

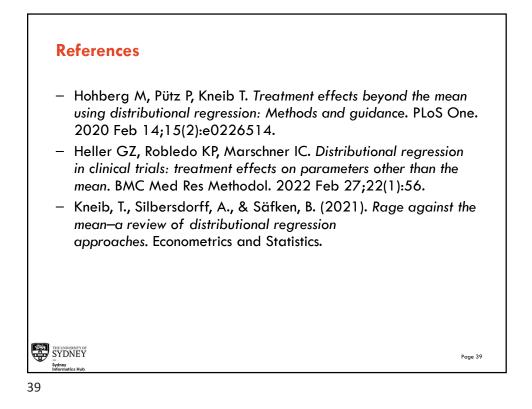

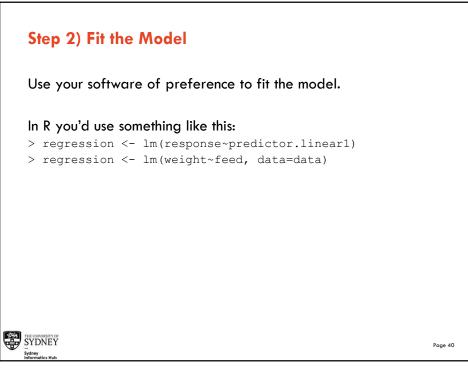

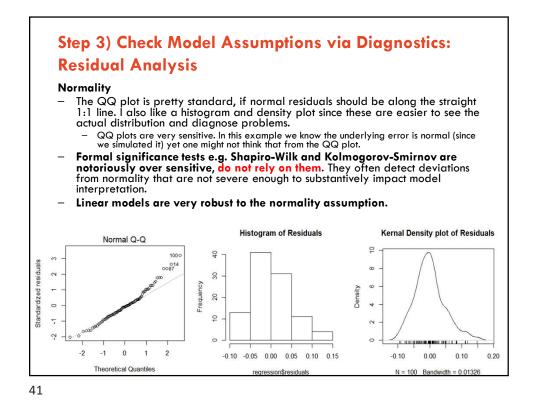

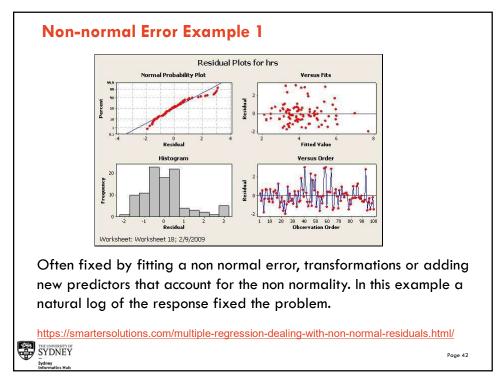

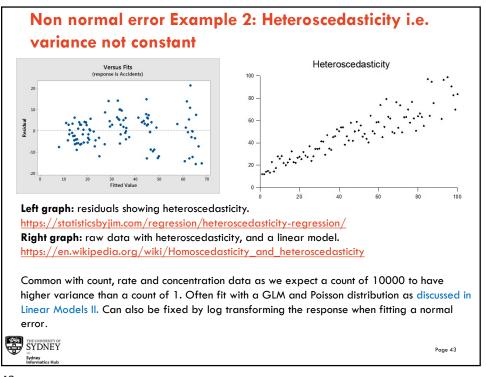

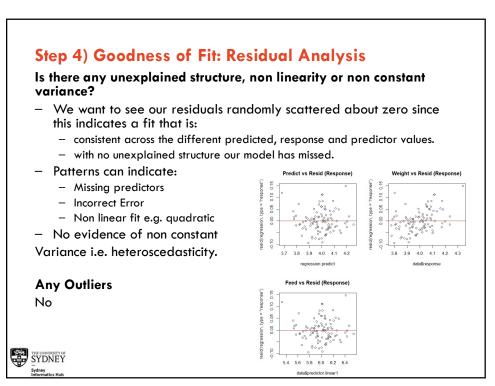

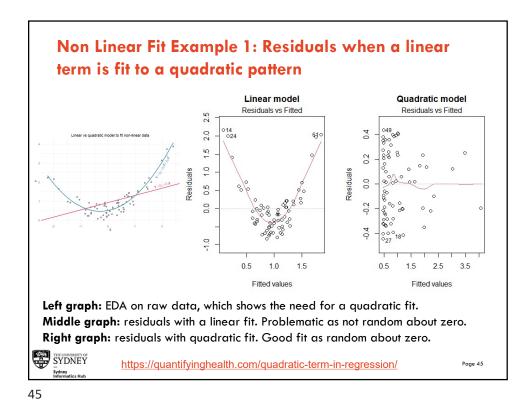

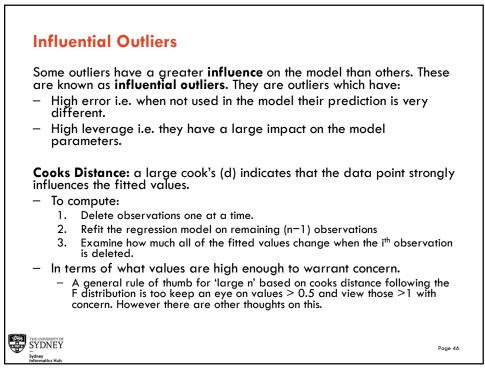

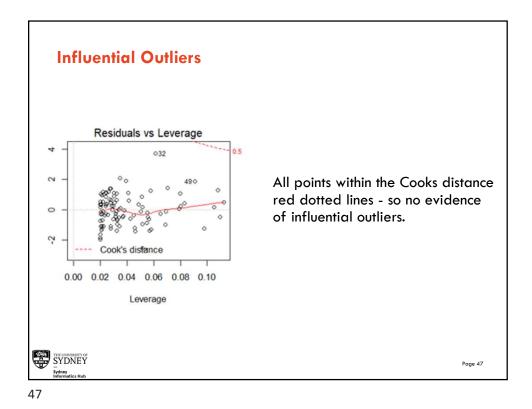

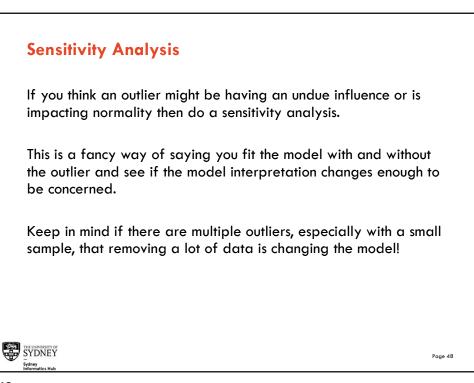

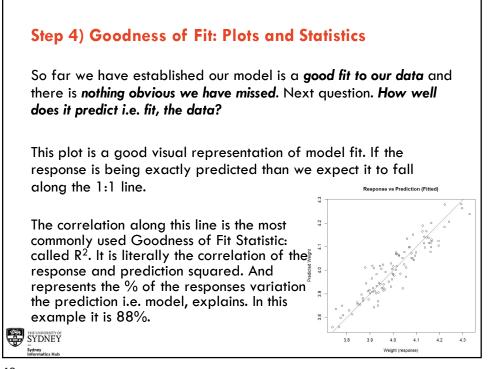

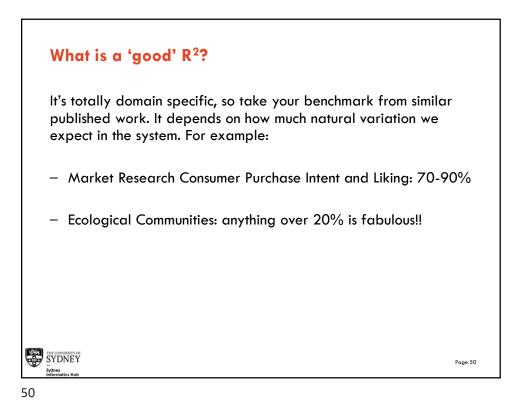

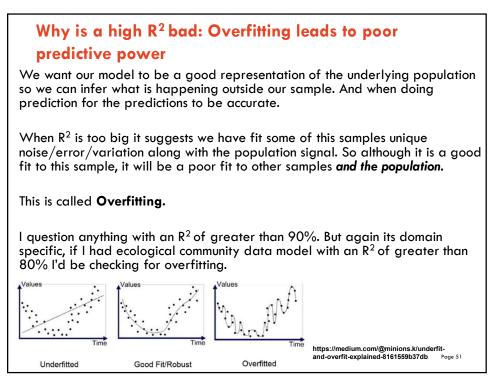

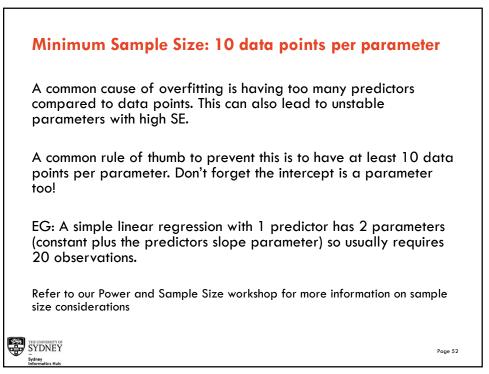

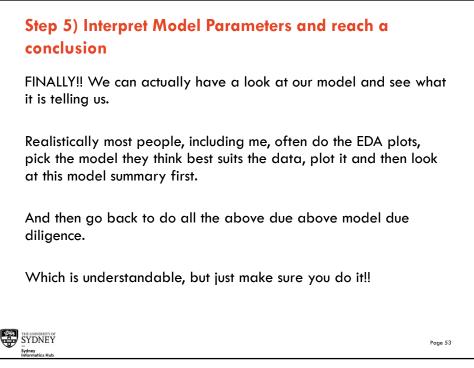

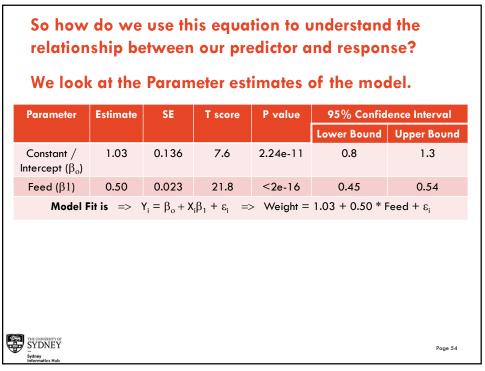

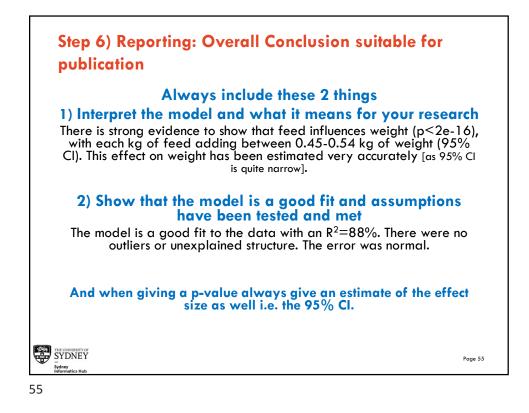

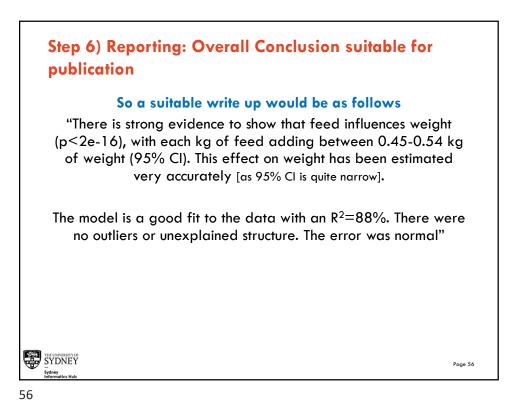

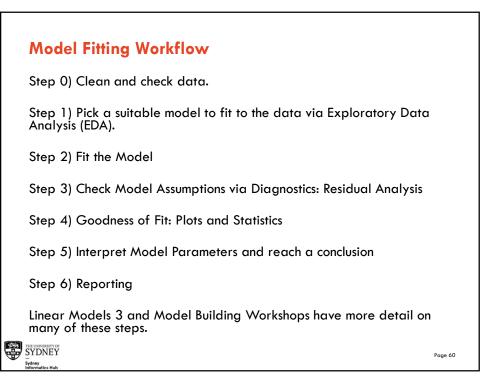

ANOVA: ANalysis Of VAriance

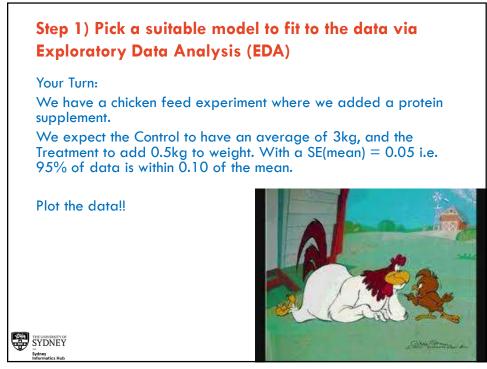

Continuous response, categorical predictor

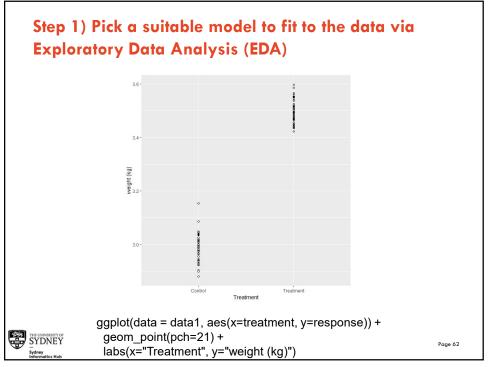

Workflow Suitable for:

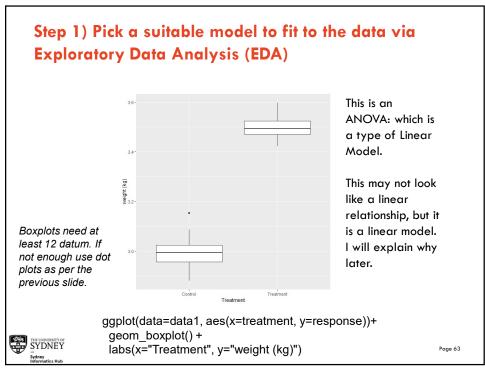

- Modelling discrete predictors (workflow shown is for 1 predictor, there are additional considerations when more than 1 e.g. Confounding, these are discussed in our Model Building workshop)
- Control vs Treatment designs
- Randomised Control Trials (RCT)

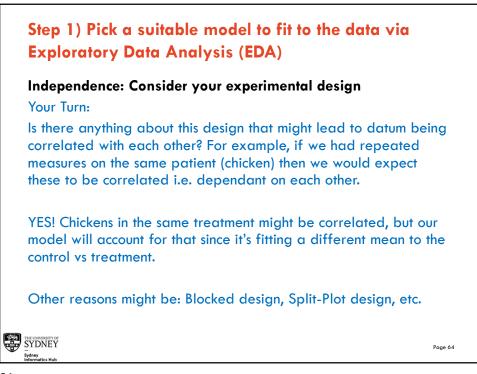

THE UNIVERSITY OF SYDNEY

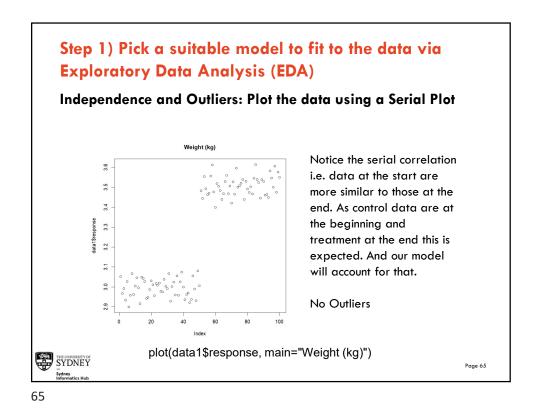

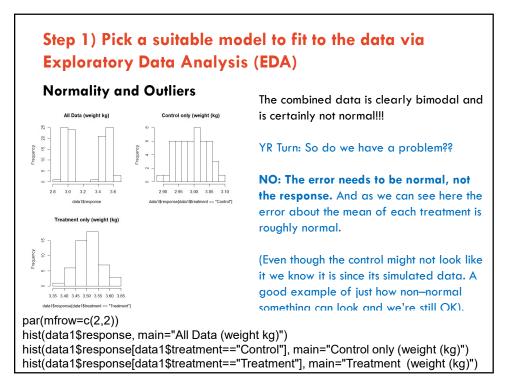

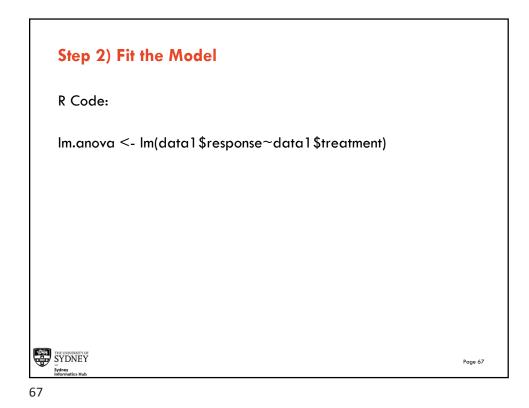

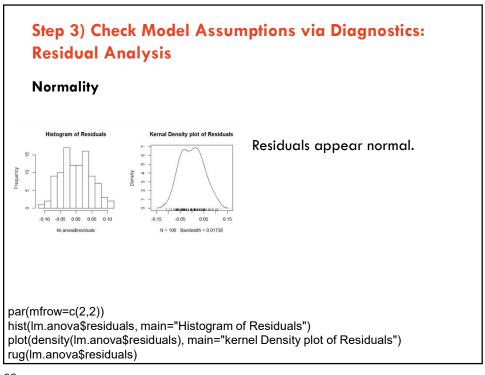

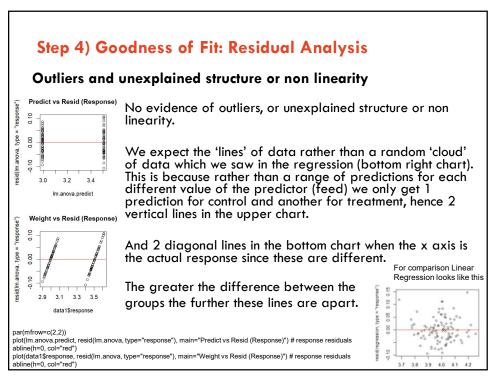

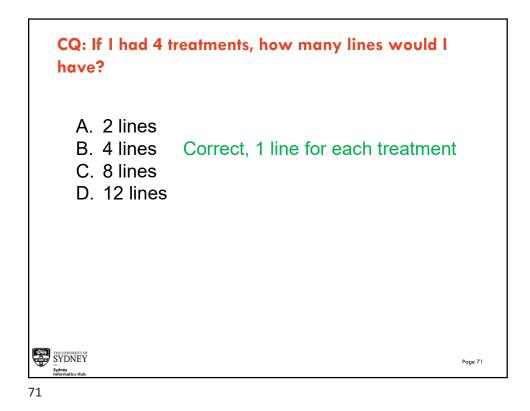

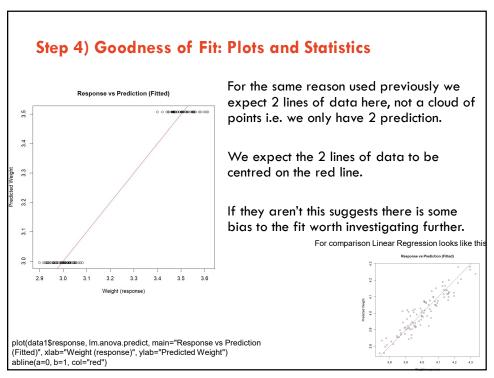

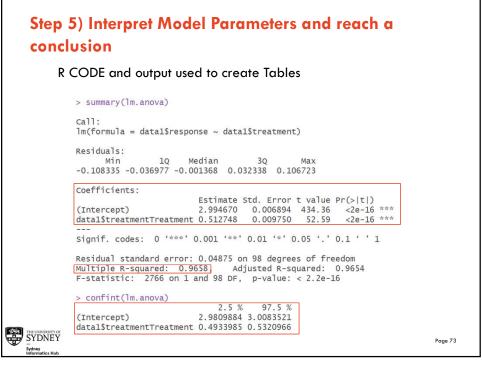

Step 3) Check Model Assumptions via Diagnostics: **Residual Analysis** Normality als vs Fitted nal Q-Q 0.10 Standardized residuals -1 0 1 2 Residuals appear normal. Combination of ANOVA and Regression

Continuous response, categorical and continuous predictors

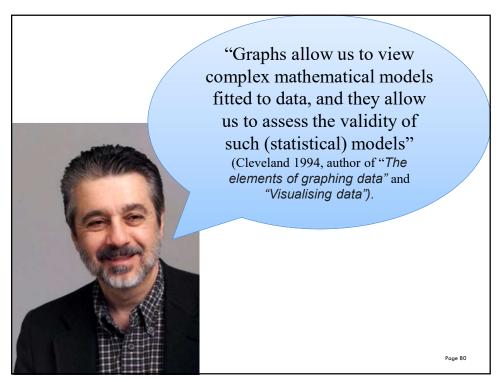

Workflow Suitable for:

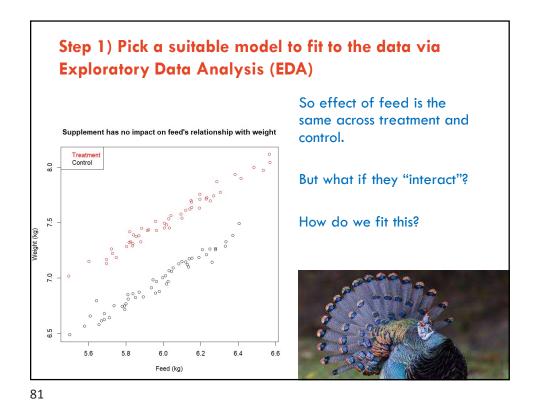

- Modelling a combination of discrete and continuous predictors (workflow shown is for 1 of each type of predictor, there are additional considerations when more than 1 e.g. confounding and multicollinearity, , these are discussed in our Model Building workshop)
- Modelling more than 1 regression line
- To test if multiple regression lines are the same, or different.
- ANCOVA: ANalysis of COVAriance
- BACI (Before After Control Impact Designs)

Mixed Models: Random Intercept Model

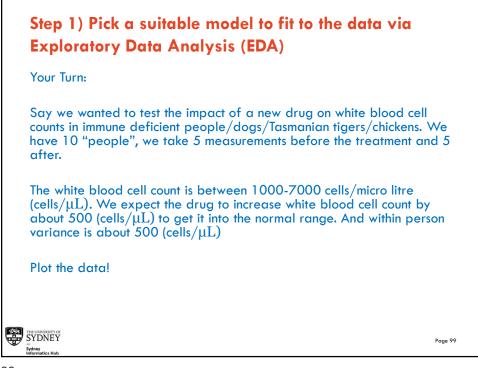

Response is measured more than once on each respondent (observational unit)

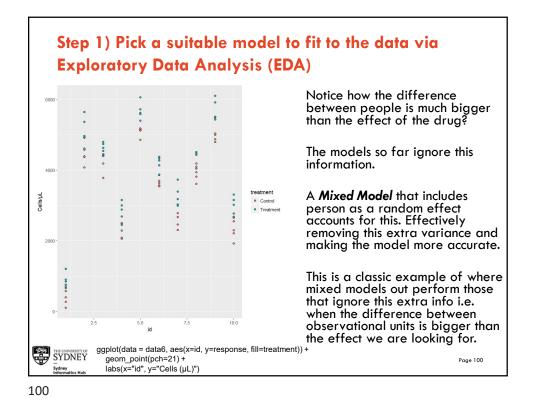

Workflow Suitable for:

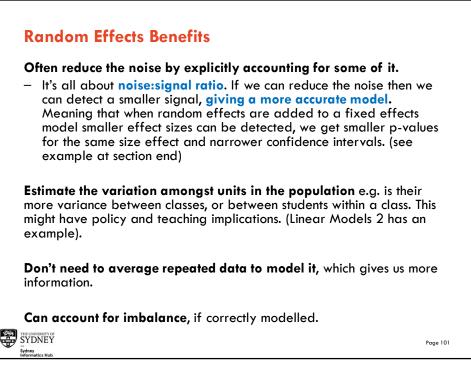

- Modelling the variance associated with the respondents (observational units). Usually gives a more accurate analysis by partitioning out the noise/variance associated with the respondents (observational units).
- Repeated Measures
- Longitudinal Analysis
- More advanced workflows suitable for:
 - Cluster Designs
 - More complex designs with repeated measures on clusters of observational units and experimental units
 - Variance Decomposition
 - Random Slopes
