

Research Essentials

Presented by Dr Ali Green
Statistical Consultant, Statistical Consulting Unit
Sydney Informatics Hub
Core Research Facilities

sydney.edu.au/sydney-informatics-hub

THE UNIVERSITY OF
SYDNEY

Slides available here

CRICOS 00026A TEQSA PRV12057

Acknowledging SIH

- All University of Sydney resources are available to researchers free of charge. The use of the SIH services including the Artemis HPC and associated support and training warrants acknowledgement in any publications, conference proceedings or posters describing work facilitated by these services.
- The continued acknowledgment of the use of SIH facilities ensures the sustainability of our services.

Suggested wording for use of workshops and workflows:

- *“The authors acknowledge the Statistical workshops and workflows provided by the Sydney Informatics Hub, a Core Research Facility of the University of Sydney.”*

What is a workflow?

- Every statistical analysis is different, but all follow similar paths. It can be useful to know what these paths are.
- We have developed practical, step-by-step instructions that we call ‘workflows’, that you can follow and apply to your research.
- We have a **general research workflow** that you can follow from hypothesis generation to publication.
- And **statistical workflows** that focus on each major step along the way (e.g. experimental design, power calculation, model building, analysis using linear models/survival/multivariate/survey methods).

Statistical workflows

- Our **statistical workflows** can be found within our workshop slides.
- **Statistical workflows** are software agnostic, in that they can be applied using any statistical software.
- To access these statistical workflows and more, visit our [Workshops and Workflows](#) page.
- The broader aim of our workshop training is to increase understanding and application of statistical concepts, to facilitate higher impact research.

Software workflows

- There may also be accompanying **software workflows** that show you how to perform the statistical workflow using particular software packages (e.g. R or SPSS). We won't be going through these in detail during the workshop. If you are having trouble using them, we suggest you attend our monthly [Hacky Hour](#) where SIH staff can help you.
- Our software workflows contain:
 - o R code and comments.
 - o SPSS syntax as well as screenshots of the point and click procedures and written methods.
 - o Screenshots of the point and click procedures and written methods for other bespoke software.

Using Artificial Intelligence (AI) responsibly

- USyd supports the responsible use of AI in research, aiming to balance innovation with academic integrity. USyd publishes its [AI guardrails](#) and [endorsed AI tools](#), and currently allows Microsoft Copilot and Cogniti to be used with public and protected data. Highly protected data must never be entered into these tools.
- The Statistical Consulting Unit (SCU) at SIH also supports AI use, but like with any tool, it should be used responsibly. The SCU recommends:
 - Being careful with handling sensitive information.
 - Verifying the accuracy of all AI-generated content.
 - Ensuring the output generated is not false, misleading, or misrepresenting findings.
- This aligns with the [Statistical Society of Australia's statement on the use of generative AI in statistics and data science](#).
- For further AI training, check out the series of [GenAI for Research workshops](#) hosted by SIH's Data Science team.

Use AI to enhance, not replace statistical collaboration – it cannot match the nuance of a statistician who understands the research question, study design and constraints.

Using AI responsibly: Tips and tricks for statistical analysis

Ask detailed questions: Align each prompt to a specific step in a statistical workflow of your choice. E.g. for linear models, see below:

Model Fitting Workflow

Step 0) Clean and check data.

Step 1) Pick a suitable model to fit to the data via Exploratory Data Analysis (EDA).

Step 2) Fit the Model.

Step 3) Check Model Assumptions via Diagnostics: Residual Analysis.

Step 4) Goodness of Fit: Plots and Statistics.

Step 5) Interpret Model Parameters and reach a conclusion.

Step 6) Reporting.

Be specific: State your outcome, predictors and how they are measured (numerically or categorically).

Protect your data:

Avoid uploading data into AI tools. Instead, describe data structure, or upload simulated data or dummy tables.

Validate code:

Check the code is statistically correct and using up to date packages and syntax. Understand what code does before running it.

Think critically:

Always review, question and verify any content produced by AI.

Understanding:

Before relying on AI, make sure you understand the statistical foundations yourself. Or you won't know when it's wrong.

Check assumptions:

AI rarely checks statistical assumptions unless explicitly asked. Check model diagnostic plots.

Statistical method should match study design:

E.g. is your model accounting for clustering or repeated measures?

Why, not just what: Ask AI to explain why certain methods are appropriate for your data.

Using AI responsibly: Tips and tricks for R coding

Tip 1: Use **headings and subheadings**, as well as the **document outline** in R Studio to break down the problem into a workflow and think systematically.

- The example below uses subheadings to outline a workflow for data cleaning and processing.
- Breaking the problem into smaller parts leads to simpler questions for AI, that are easier to check.

```
# ... ----  
# 3 DATA CHECKING AND CLEANING ----  
## 3.1 Unique Identifier ----  
# Expecting a unique identifier in the data export.  
# We should not have duplicate values as there is one response per respondent.  
  
unique.id <- combined_all # creating a save point!  
names(unique.id) # check for the correct variable name and update the code below  
  
# CHECK: the unique identifier is unique  
table(duplicated(unique.id$UID))
```

Tip 2: Under each heading/subheading write out the **purpose of the section**. Include AI prompts, as well as ideas for later (coding tends to be iterative).

```
0 Setup  
1 Import Data  
  1.1 Read Data  
  1.2 Import checking  
2 Combining data files  
  2.1 Joining  
  2.2 Bind rows  
3 Data Checking and Cleaning  
  3.1 Unique Identifier  
  3.2 Data of Interest  
  3.3 Unexpected characters  
  3.4 Convert to numeric  
  3.5 Create Factors  
  3.6 Check Factor Levels  
  3.7 Missing Data  
  3.8 Duplicated Data  
  3.9 Flatliners  
  3.10 Outliers  
  3.11 Final clean data  
4 Create variables  
  4.1 Top box
```

Using AI responsibly: Tips and tricks for R coding

Tip 3: Every section has a check!

- This can be as simple as just having a look at the output, dimensions, or crosstabulations.
- Keep in mind you are responsible for your work and need to ensure your code does exactly what you want it to do. This is especially important when using AI as it can hallucinate!

E.g. Should the number of rows change after joining a second data file (number of participants)?

```
> # CHECK: no additional rows
> nrow(raw_data_metro) # original n = 100
[1] 100
> nrow(combined_metro) # combined file should be the same!
[1] 100
```

E.g. Did all values get recoded correctly (were any NAs generated)?

```
> # CHECK: crosstab of original variable and new numeric variable
> # Looks good
> convert.numeric |>
+   count(Q3, Q3_numeric) |>
+   arrange(Q3_numeric)
```

	Q3	Q3_numeric	n
1	Strongly Disagree	1	15
2	Disagree	2	45
3	Neither Agree or Disagree	3	65
4	Agree	4	42
5	Strongly Agree	5	27

During the workshop

- Ask short questions or clarifications during the workshop (either by Zoom chat or verbally). There will be breaks during the workshop for longer questions.

- Slides with this blackboard icon are mainly for your reference, and the material will not be discussed during the workshop.

- Challenge questions will be encountered throughout the workshop.

Research Essentials workshop overview

8-step general research workflow and other resources

- Where does this Workshop fit into the research process?
- Where does it fit in with other SIH training and support on offer?

Setting up your data for most analyses:

- Step 3: Collect and store data
- Step 4: Cleaning data

Workflow examples for common analyses – brief introduction to:

- Step 5: Exploratory data analysis
- Step 6: Inferential analysis

8-step general research workflow

General research workflow

1. **Hypothesis Generation** (Research/Desktop Review)
2. **Experimental and Analytical Design** (Sampling, power, ethics approval)
3. **Collect/Store Data**
4. **Data cleaning**
5. **Exploratory Data Analysis (EDA)**
6. **Data Analysis aka inferential analysis**
7. **Predictive modelling**
8. **Publication**

6. Statistical Inferential analysis – from sample to population

Statistical inference:

“The theory, methods, and practice of forming judgments about the parameters of a population, usually on the basis of random sampling.”

Collins English Dictionary

7. Predictive modelling – Inferential predictive statistics versus machine learning predictive analytics

- **Inferential predictive statistics**

Predicting temperature rise in climate change.

- **Machine learning/predictive analytics**

Very accurately verify fingerprint to unlock a mobile phone.

Ecosystem of SIH statistical training

Research data that is managed optimally improves research efficiency and reach, as well as ensuring its integrity and security, and meeting legislative/policy/funding/publishing requirements.

The Research Data Consulting team assists researchers to enhance their research productivity and improve data management practices. They provide:

- Short consultations to integrate digital tools and data management into your research.
- Training and functional support for university supported tools/platforms.

Drop in support sessions

For researchers who code or analyse data

Hacky hour

sydney.edu.au/informatics-hub/hacky-hour

- Experts & mentors from SIH and across the University will be available to advise and answer questions on coding, data analytics or digital tools.
- Join us on zoom the **3rd Wednesday of every month, 2 - 3pm!**

HPC drop in sessions

<https://sih.tools/hpc-dropin>

- Users of NCI Gadi and Pawsey Setonix HPC can get technical support with troubleshooting, optimising their code.
- Join us on zoom the **1st Thursday of every month, 12 - 12:30pm!**

Sydney Informatics Hub – Statistics & Bioinformatics drop-in sessions @ Westmead

Stuck on a *stats or informatics* problem?

Bring your toughest questions — we're here to help you find answers!

Just Walk In!

 **When:** First Thursday of each month from 12 – 1:30 pm

 **Where:** C24K Level 6 Meeting Rooms 6117 Wagtail
and 6118 Lyrebird

If statistical programs were cars...

The first question: Which car will you take?

Excel

Stata

SPSS

R

Python

SAS

The first question: Which car will you take?

Getting from step 3 to step 8 will involve using software. Will it be:

Graphical User Interface (GUI) – like an automatic car
Interactive, point and click and
Menu driven
Easier to get started

Command line interface (CLI) – like a manual car
Writing code
Easier to handle complex
and/or large data sets

CLI

Software choice as the first question: GUI versus CLI

- Which software are you more familiar or comfortable with?
- How do you record your analysis for reproducible research?
- By documenting, you should always be able to re-run your analysis from start to finish (and get the same result)!
- If using interactive processing, you should keep track of the commands you run.

Graphical User Interface (GUI) **SPSS**

Command line interface (CLI) **R** code

```
R
R> lm(Sepal.Length ~ Species, data = iris)

Call:
lm(formula = Sepal.Length ~ Species, data = iris)

Coefficients:
(Intercept)  Speciesversicolor  Speciesvirginica
      5.006             0.930             1.582

R> |
```

Statistical software used at USyd

- A variety of statistical software options are supported at USyd, and what you use may depend on your lab or faculty or school.
 - The main two we see in our statistical consulting are R (CLI) and SPSS (GUI).
 - We also consult with clients using jamovi, SAS, Stata, Graphpad Prism, Python and Genstat.
- To access these and more:
 - As a student you may need to access via the citrix workspace: [Student IT: Apps](#)
 - As a researcher (or anyone with valid staff ID): [What software is available to University staff?](#)

3. Collect/store your data

A. Research data management

B. Organise your data for input into statistical software

A. Research data management

- **Data storage**
- Back up EVERYTHING including original data collection forms or raw data (images, electrical signals, DNA sequences, whatever).
- **Data entry - will you be using manual data entry?**
- Ideally double-data entry followed by comparison.
- Be wary of spreadsheets – especially entering, editing analysing in the same sheet.
- Statistical software generally doesn't allow easy editing once you have entered your data.

A. Research data management

- **Have you got a Research data management plan according to University policy?**
 - What is a Research Data Management Plan (RDMP)?
 - What are the university supported tools for data collection and storage?
 - What is an eNotebook?
 - Where can I store my data?
- **Consider appropriate folder/directory structure, file naming and version control for your project, *or at least your part of it.***
 - Good enough practices for scientific computing
 - Best practices for data management and sharing in experimental biomedical research

A. Research data management

Guide to storing and managing your projects research data

University supported and licenced platforms

●	highly protected
○	highly protected data needs additional file encryption
●	protected
●	public

Highly Protected data may require additional encryption depending on some platforms. Protected data may benefit from encryption.

For more information about research data classifications, go to <https://sydney.edu.au/research-data-classifications>

For research data management enquiries, please contact digital.research@sydney.edu.au

A. Version control – keeping track of your files

- Use a separate directory for each discrete analysis.
- When processing data and intermediate files save with a new name.
 - Use a good file naming convention to keep track of files.
- Save frequently so if you lose a version, you do not have to redo too much work.
- For collaborative research consider using eNotebook or other version control systems, e.g. Git (free) or GitHub.
- Create a log file in the same directory and use version control (e.g. name sequentially, date/time stamp, for example:
 - “20230208 stats101 workshop v2.0.xlsx” (orders files chronologically).

A. Version control – keeping track of your files

Example of a version log file in Excel:

File name	Description	# Obs	# Vars
Mydata_v1_30102022.csv	Original data entry by KS, 1 record per person	250	34
Mydata_v2_01112022.csv	Eligible records only based on study inclusion criteria with new variables created for analysis: BMI calculated from recorded height and weight; babies age processed to be consistently in months instead of days and weeks as well; number of pets categorised (none, 1-2, 3+)	204	37

B. Data formats – tidy data

- Depending on the design of your experiment/survey you may have a mix of demographic data on each individual, and measurements.
 - You may need multiple tables and a unique ID for each individual to link them, or just have the demographic data repeated when transforming to long format
- Wide and long can become relative terms especially if you have clusters of subjects.
- Tidy data is a consistent way to should have:
 - One variable in each column
 - One observation per row
 - One value per cell

country	year	cases	population
Afghanistan	1999	18215	15467071
Afghanistan	2000	18666	20085360
Brazil	1999	31737	172036362
Brazil	2000	81488	17404898
China	1999	211258	1272015272
China	2000	211766	1280015583

variables

country	year	cases	population
Afghanistan	1999	18215	15467071
Afghanistan	2000	18666	20085360
Brazil	1999	31737	172036362
Brazil	2000	81488	17404898

Brazil	2000	81488	17404898
China	1999	211258	1272015272
China	2000	211766	1280015583

values

B. Data formats – transformations

Patient ID	Time 1 Body weight	Time 2 Body weight	Time 3 Body weight
1	50	55	60
2	47	49	50
...	...	...	...

**Wide/unstacked
format**

Patient ID	Time	Body weight
1	1	50
1	2	55
1	3	60
2	1	47
2	2	49
2	3	50
...	...	...

**Long/stacked
format**

B. Organising a dataset for analysis

- **Most programs read in data in a rectangular format:**
 - E.g. A text file – you can read it in Notepad or any text editor or Excel, csv etc.
 - A header including column names in the first row.
 - Each row thereafter being the data itself (often corresponding to a single unit of interest – e.g. person, animal, plant, plot, farm, machine, business, school, hospital etc).
 - Each column represents one variable.
 - ID variable – identifies the subject.
 - Demographic variable – characteristics of the subject. including their treatment.
 - Measurement variable – some observation on the subject.
 - A delimiter between each column (comma .csv and tab .tsv/.tab/.txt).
 - Do a quick skim of your dataset and look at the corners to see if it is actually rectangle.

B. Pitfalls when coming from Excel

- Watch out for:
 - Merged cells
 - Cell comments
 - Colour coding
 - Blank rows
 - Data in multiple sheets
 - Particular coding of missing data/blanks/non-applicable
- Deal with the above in Excel before exporting to text. Sometimes these have been added to annotate the data, or make it easier to read. Other times, annotations must be represented in text file.
- A good summary of these pitfalls is provided in [this paper](#).
- Check your data once it is imported into the statistical software.

B. Organising a dataset for statistical analysis – data coding

- Specify type of variable: ensure your analysis software knows whether a variable is numeric (continuous or discrete), or categorical/factor/string/character (text).
- Label variables, either within the software or by keeping your own record (e.g. Age = Age at interview in years).
- Label variable values/'levels' within categorical variables. While numerical codes are often displayed when you extract survey data, e.g. from your REDCap project, the data may come without label definitions, so keep track of these, e.g. 1 = "Male", 2 = "Female", 3 = "Non-binary".
- Correctly code missing values according to software program: ensure your analysis software knows that the data is missing and not '0' or some other value (e.g. 999, 777, 99, 77).

4. Data cleaning

Data cleaning: data wrangling and data dictionary

A simple example of a data dictionary:

	A	C	D
1			
2	Questions	Categories	Code used
3	Q1_Age(years)	20-30	1
4		31-40	2
5		41-50	3
6		51-60	4
7		>60	5
8	Q2_Gender	male	1
9		female	2

- Data cleaning involves examining* the variables in the dataset and creating new variables for analysis by recoding/processing variables as required.
- Use short but informative variable names; it's a good idea to have a data dictionary.
- Names should keep track of transformations/recoding, e.g.
 - age = original data in years.
 - age_c2 = age categorised into two categories (young vs old).

Data cleaning: data wrangling and data dictionary

- If you are using R, the janitor package is great for cleaning up variable names.
 - [janitor: Simple Tools for Examining and Cleaning Dirty Data](#)
- Regardless of your software choice, below are some suggested styles for naming your variables:

Case Style	Argument (in R)	Example
Snake case	"snake"	employee_id
Lower camel case	"lower_camel"	employeeid
Upper camel case	"upper_camel"	EmployeeId
Screaming snake case	"screaming_snake"	EMPLOYEE_ID
Lower case	"lower"	employeeid
Upper case	"upper"	EMPLOYEEID
Title case	"title"	Employee Id
Sentence case	"sentence"	Employee id
Pascal case	"pascal" (alias for "upper_camel")	Employeeid
Small camel case	"small_camel" (alias for "lower_camel")	employeeid

Keep track of analyses

- **Remember you should be able to repeat analysis from the start, to demonstrate/enable reproducibility.**
- **For statistical programming languages:**
 - Name the program file logically.
 - Use structure, work in blocks or ‘chunks’ of code for different sections, e.g. ‘descriptive analyses’ – do it for all predictors in one go.
 - Log file – same name as program file, different extension – VERY important as record for interactive mode!
 - Use functions to avoid repetition.
 - Use appropriate level of comments, e.g. key steps and results.
 - Consider using an Rmarkdown/Quarto notebook if using R.
- Also covered in [Good enough practices in scientific computing](#).

Data cleaning in action

Remember to have tidy rectangle data BEFORE you import into your chosen software, so first delete rows 1 to 4 and 26 to 28. Then, once in your chosen software, clean each variable column one at a time by looking at their distribution*.

***In R, you will be able to do all of the cleaning there, including removing rows 1 to 4 and 26 to 28 but sometimes it is easier to have a tidy dataset before import.**

Variable types are important!

Why worry about variable types?

- **Variable types determine the appropriate statistical methods for analysis.**
- You need to know what data type your variable is AND how it is recorded in your dataset.
- You may need to convert a numeric variable to a categorical variable depending on its distribution.

A. Identify variable types

Variable types

CONTINUOUS

measured data, can have ∞ values within possible range.

I AM 3.1" TALL
I WEIGH 34.16 grams

DISCRETE

OBSERVATIONS can only exist at LIMITED VALUES, often COUNTS.

I HAVE 8 LEGS
and
4 SPOTS!

@allison-horst

Variable types

NOMINAL

UNORDERED DESCRIPTIONS

ORDINAL

ORDERED DESCRIPTIONS

BINARY

ONLY 2 MUTUALLY EXCLUSIVE OUTCOMES

@allison_horst

Variable types – Example Cath dataset

- Dataset from the Duke University Disease Databank – an observational cohort study.
- Patients were referred to the clinic for chest pain and cardiac catheterisation was performed to diagnose and open blockages in the arteries, followed by stenting to keep them open.
- 3504 participants

Cath Dataset Description

Document: This dataset was not published as a manuscript but has been generously provided by Frank Harrell.

Variable types – Example Cath dataset

Codebook

variable	position	Variable_Label	units	Codes	type
sex	1	Gender		0 = male, 1 = female	double
age	2	Age	years		double
cad_dur	3	duration of cardiac symptoms	days		double
choleste	4	Serum Cholesterol	milligrams per deciliter		double
sigdz	5	Significant Coronary Artery Disease Found on Cardiac Cath		0 = no, 1 = yes	double
tvdlm	6	Three Vessel or Left Main Disease Found on Cardiac Cath		0 = no, 1 = yes	double

B. Descriptive analysis for individual variables

Categorical variables

Graphical summaries

- Bar charts

Tabular summaries

- Frequency tables

Numerical variables

Graphical summaries

- Histogram
- Boxplots

Tabular summaries

- Numerical summary statistics of centre (mean, median mode) and spread (quartiles, percentiles, sd)

Example Cath dataset – How to summarise categorical variables?

Cath Dataset Description

Document: This dataset was not published as a manuscript but has been generously provided by Frank Harrell.

Example Cath dataset – How to summarise categorical variables?

- Frequency – count the number of males and females

```
sex    n    percent
0  2405  0.6863584
1  1099  0.3136416
```

Where 0 = male, and 1
= female

Example Cath dataset – How to summarise numerical variables?

- Serum cholesterol (mg per dl) of the participants who provided a response
- A frequency table would be long and messy. Not a great summary!

Example Cath dataset – How to summarise numerical variables?

- **Age (years) of the participants who provided a response**
- A bar chart isn't the best either!

Example Cath dataset – How to summarise numerical variables?

- **Age (years) of the participants who provided a response**
- A histogram of age, with frequency shown with equally sized bins ($n = 20$).

Shapes of the distribution

Symmetric distribution

Examples of Skewed Distributions

Asymmetric distribution

Example Cath dataset – How to summarise numerical variables?

- Another way to summarise a numerical variable is through a boxplot.

Example Cath dataset – Summarising the boxplot

- **A numerical distribution can be summarised by giving descriptions of:**
 - Its shape
 - Symmetric, right or left skewed
 - Its centre
 - Measures of central value or location
 - Its spread
 - Measures of spread or dispersion

Parametric versus Nonparametric stats

- **Parametric**

- Based on assumptions about data distribution and shape.
 - Normality
 - Though quite robust in large samples due to the central limit theorem.
 - Homogeneity of variance.
- Mean and standard deviation reported.
- Suitable for larger samples, with a normal distribution. More powerful if assumptions met.
- Examples:
 - 2-sample t-test
 - General linear model (GLM, One-way Anova, Least squares regression)

- **Nonparametric**

- Not based on assumptions about data distribution and shape.
- Median and percentiles/quartiles/max and min reported.
- Suitable for smaller samples, skewed data or ordinal variables.
- Examples:
 - Mann-Whitney U
 - Kruskal-Wallis
 - Spearman correlation

With the rise of GLMs and other more flexible parametric methods, such as distributional regression, quantile regression and generalised additive models, nonparametric methods are becoming less useful (and are now less of a requirement for publication).

Improving data distribution with transformations

- **Why check the distribution?**
 - Helps us understand skewness and any extreme values in the raw data.
- **Common transformations:** log, square root, inverse, Box-Cox.
 - We cannot take a log of 0, so if the raw data contains values of 0, add a constant to the variable before taking the log.
E.g. $\log(x + 1)$.
- Checking the raw data is an important part of EDA. However, when fitting linear models, we assess distributional assumptions using the residuals, not the raw data. See the [Linear Models 1](#) workshop for more information.

[Best practice in statistics: The use of log transformation](#)

Improving data distribution with transformations

- **UN:** Blood Urea Nitrogen. Numeric. Range: 2-118. 53 missing values.

Improving data distribution with transformations

- **ALK:** Alkaline phosphatase. Numeric, range 13-1938, 0 missing values.

Improving data distribution with transformations

- **ALT:** Alanine Transaminase. Numeric, range 1-10666, 18 missing values.

What is a systematic approach to conduct descriptive analyses for individual variables?

Categorical variables

Graphical summaries

- Bar charts

Tabular summaries

- Frequency tables

Don't forget to check for missing data/NAs!

For formatting tips, check your target journal's instructions to authors or recent publications in that journal!

Numerical variables

Graphical summaries

- Histogram
- Boxplots

Tabular summaries

- Symmetric?
 - Mean, standard deviation, minimum and maximum.
- Asymmetric?
 - Median, quartiles, minimum and maximum.

Variable types are important for describing the distribution of each variable and checking/cleaning each individual variable, but....

What about my research question and analysis?

Formulating your research question

- Your research question should clearly detail the problem that is being addressed in your study. It should be a focused and answerable question that guides the content of your study.
- Start by identifying a gap in existing knowledge, and then refine your research question to be specific, measurable and relevant to your field.
- Depending on your research field, there may be a specific framework to follow when developing your research question. E.g. the PICO framework which helps structure clinical research questions by breaking them down into: Population, Intervention, Comparison and Outcome.

[Write a research project plan](#)

[Back to the basics: guidance for formulating good research questions](#)

[What's Your Problem? Writing Effective Research Questions for Quality Publications](#)

What is the research question?

Depending on who taught you statistics, your discipline, stats software or textbook, you may have come across some of these terms and more!

- For any analysis we need to be clear what the functional classification of the variables in the dataset is, e.g. we want to investigate the effect of smoking on lung disease:

Smoking (yes/no)
Predictor, explanatory
variable, risk factor,
independent variable*

Lung disease (yes/no)
Response, outcome,
dependent variable

*This term is frequently used, but we don't promote it as predictors may be correlated and hence are not independent.

Other functional classifications for variable types

- Covariate: a measured predictor (numerical predictor variable).
- Factor: (a categorical predictor variable).

Experimental design variables:

- Design variables: Based on the physical design of the experiment. They are often included in the analysis even if not 'significant' e.g., correctly partition the variance e.g., Block (batch of reagent, source of lab mice), subject ID, etc.
- Treatment: Variables of interest, e.g., diet, drug treatment, intervention etc. NB: The 'levels' of a 'treatment variable' might include 'control (placebo)', 'treatment 1 (drug 1)', 'treatment 2 (drug 2)'.

More information on design variables in our Experimental Design workshop!

What is the outcome variable?

- **Review study aim and objectives**
- E.g., vaccine RCT - daily morbidity outcome data could be analysed as:
 - mean daily rate (average – numerical).
 - cumulative morbidity (sum – numerical).
 - peak morbidity (maximum – numerical).
 - outbreak presence/absence (binary group – categorical).
 - time to infection/disease outbreak (time to binary event data – survival analysis).

More data processing

- **Assess all variables for missing observations – if many missing consider analysing with and without that predictor.**
- **Check the distribution of all variables individually (previous step).**
- Numerical predictors: handle as numerical or categorical?
- Categorical: may have to combine categories if there are low frequency counts (if it makes sense to do so).
- **Multi-level (clustered) data**
- Each observation/row uniquely identified? E.g., herd, animal, ID.
- Evaluate hierarchical structure of your data: Average/range of observations at one level in each higher level?
- E.g., mean, min, max of students/class; mean, min, max of classes/school.

A quick primer to Step 5: EDA

Your variable types will dictate the type of statistical analysis you perform

- The type of outcome and explanatory variables you have will dictate the type of EDA and inferential analysis you can do, so it is crucial to think about this and your research question before you collect your data!
 - Is your outcome numerical or categorical?
 - Are your explanatory variables numerical or categorical?
 - Do you have one or multiple outcomes and/or explanatory variables?
- Choosing the wrong analysis can violate statistical assumptions and often won't run properly in your statistical software. Even worse, the incorrect analysis could lead to erroneous results and therefore conclusions or policy!

Step 5: Exploratory data analysis (EDA)

It will depend on the analysis and variables involved.

Basic EDA is where you plot the relationship of each predictor with the outcome, and you may need to reconsider data processing. E.g. Do I need to merge more categories together?

Two categorical variables

- Contingency table
- Side-by-side bar chart

A categorical and a numerical variable

- Tabulate summary statistics by groups
- Box-and-whisker plot by groups

Two numerical variables

- Scatter plot and correlation coefficient r

XY scatterplot and Pearson's correlation coefficient (r)

A quick review of correlation coefficient r to describe the relationship of two numerical variables in a scatter plot; $r = 0$ means no relationship – data points in a random scatter.

Coefficient, r		
Strength of association	Positive	Negative
Small	0.1 to 0.3	-0.1 to -0.3
Medium	0.3 to 0.5	-0.3 to -0.5
Large	0.5 to 1.0	-0.5 to -1.0

Statistical Power
Analysis for the
Behavioral Sciences,
Cohen 1988

Examples for reporting descriptive analyses:

- Plotting gives a quick visual summary during EDA and highlights any issues.
- Tables are more publication friendly as they save space!
 - This step of the statistical analysis process is often seen in Table 1 of your manuscript.
 - See this paper for more information: [Who is in this study, anyway? Guidelines for a useful Table 1.](#)

Examples for reporting descriptive analyses: Cath dataset

Table 1. Summary statistics for the variables in a study of patients undergoing cardiac catheterisation, split according to sex.

	Male (N=2405)	Female (N=1099)	Overall (N=3504)
Age [Year]			
Mean (SD)	51.6 (9.83)	53.8 (9.99)	52.3 (9.93)
Median [Min, Max]	52.0 [17.0, 82.0]	54.0 [20.0, 81.0]	52.0 [17.0, 82.0]
Duration of Symptoms of Coronary Artery Disease			
Mean (SD)	43.0 (58.1)	43.0 (58.3)	43.0 (58.2)
Median [Min, Max]	17.0 [0, 416]	20.0 [0, 404]	18.0 [0, 416]
Cholesterol [mg %]			
Mean (SD)	227 (47.3)	237 (56.9)	230 (50.6)
Median [Min, Max]	223 [63.0, 500]	230 [29.0, 576]	225 [29.0, 576]
Missing	836 (34.8%)	410 (37.3%)	1246 (35.6%)
Significant Coronary Artery Disease			
No	533 (22.2%)	637 (58.0%)	1170 (33.4%)
Yes	1872 (77.8%)	462 (42.0%)	2334 (66.6%)
Three Vessel or Left Main Disease			
No	1463 (60.8%)	909 (82.7%)	2372 (67.7%)
Yes	941 (39.1%)	188 (17.1%)	1129 (32.2%)
Missing	1 (0.0%)	2 (0.2%)	3 (0.1%)

[Cath Dataset Description Document](#): This dataset was not published as a manuscript but has been generously provided by Frank Harrell.

Other examples for reporting descriptive analyses:

Midurethral Sling vs OnabotulinumtoxinA in Females With Urinary Incontinence

Table 1. Demographics and Baseline Characteristics

Characteristic	No. (%)	No. (%)
	OnabotulinumtoxinA (n = 71) ^a	Midurethral sling (n = 66) ^a
Age, mean (SD) [range], y	59.1 (11.4) [27-78]	59.0 (11.7) [33-87]
Race ^b		
Asian	2 (2.8)	0
Black/African American	10 (14.1)	10 (15.2)
Native Hawaiian or Other Pacific Islander	1 (1.4)	1 (1.5)
White	55 (77.5)	54 (81.8)
Unknown/not reported	3 (4.2)	1 (1.5)
Hispanic/Latino ethnicity, No./total (%) ^c	15/71 (21.1)	6/65 (9.1)
Education, highest level obtained was greater than high school, No./total (%)	46/68 (68.5)	32/63 (48.5)
Currently smoking	7 (9.9)	9 (13.6)
No. of vaginal deliveries, median (IQR)	2 (1-3)	2 (1-3)
Total No. of deliveries, median (IQR)	2 (1-3)	2 (1-3)
Menopausal status		
Pre	7 (9.9)	14 (21.2)
Post	56 (78.9)	49 (74.2)
Not sure	8 (11.3)	3 (4.5)
Currently using estrogen by prescription	21 (29.6)	18 (27.3)
BMI, mean (SD) ^d	34.3 (8.3)	35.0 (7.6)
Type of urinary incontinence ^e		
Stress predominant	3 (4.2)	4 (6.1)
Urge predominant	7 (9.9)	10 (15.2)
Balanced	61 (85.9)	52 (78.8)
Baseline incontinence episode daily frequency, mean (SD)	7.1 (4.1)	7.4 (4.0)
Time from baseline visit to treatment, mean (SD), d ^f	59.0 (38.5)	56.8 (43.4)
Median (IQR)	49 (36-75)	46 (27-76)
Treatment >90 d after baseline	7 (9.9)	10 (15.2)
Baseline UDI scores, mean (SD) ^g		
Total	187.6 (38.2)	180.9 (36.5)
Irritative	75.7 (16.6)	73.7 (15.4)
Stress	86.6 (18.4)	80.3 (21.9)

Abbreviations: BMI, body mass index; UDI, Urogenital Distress Inventory.

^a The primary analysis population is defined as all participants who received any treatment and have postbaseline efficacy data, regardless of randomized treatment.

^b Race categories were self-reported using check all that apply and specific closed options, including an unknown/not reported selection.

^c Ethnicity categories were self-reported using select only one, specific closed option, including an unknown/not reported selection.

^d BMI calculated as weight in kilograms divided by height in square meters.

^e The type of urinary incontinence is defined by responses at baseline on the UDI to the urgency urinary incontinence (UUI) item "Do you experience urine leakage related to a feeling of urgency? If yes, how much does it bother you?"

and stress urinary incontinence (SUI) item "Do you experience urine leakage related to physical activity, coughing or sneezing? If yes, how much does it bother you?" Greater bother reported on the UUI item is classified as stress predominant, greater bother reported on the SUI item is classified as stress predominant, and equal bother reported is classified as balanced.

^f Baseline refers to the time of the first UDI assessment completion, which is used to determine eligibility. Participants were expected to receive treatment within 91 days of completing their baseline UDI.

^g The UDI total score ranges from 0 to 300, and the UDI irritative and stress scores range from 0 to 100, with higher scores indicating greater symptom severity.

Immunogenicity and Safety of Influenza and COVID-19 Multicomponent Vaccine in Adults ≥50 Years

Table 1. Participant Demographics and Baseline Characteristics (Safety Population)^a

<30	1077 (54.0)	1096 (55.2)	951 (48.4)	927 (46.8)
≥30	918 (46.0)	888 (44.8)	1012 (51.6)	1053 (53.2)
Comorbidity group, No. (%)				
High risk ^e	1312 (65.2)	1292 (64.4)	1233 (61.9)	1264 (63.0)
Low risk	699 (34.8)	714 (35.6)	760 (38.1)	741 (37.0)
Influenza vaccine received since Sept 2022, No. (%)	1019 (50.7)	1016 (50.6)	783 (39.3)	784 (39.1)
COVID-19 vaccine received since Sept 2022, No. (%)	853 (42.4)	854 (42.6)	632 (31.7)	611 (30.5)

Abbreviations: BMI, body mass index (calculated as weight in kilograms divided by height in meters squared); HD-IV4, high-dose quadrivalent inactivated influenza vaccine; SD-IV4, standard-dose quadrivalent inactivated influenza vaccine.

^a The safety population included all participants who were randomized and received the study vaccination. Participants were included in the vaccine group corresponding to the vaccine they received.

^b Due to misrandomization, 2 participants aged 50-64 years were enrolled in the ≥65 years cohort and 3 participants aged ≥65 years were enrolled in the 50-64 years cohort.

^c Race and ethnicity of participants was self-reported according to multiple categories. The total number of participants with a reported race (excluding participants with race unknown or unreported); percentages are based on this total.

^d The total number of participants with a reported BMI group (excluding participants with unknown BMI group); percentages are based on this total.

^e High-risk comorbidity included having any medical history of autoimmune/immune-mediated disease, blood disorders, cardiac disorders, nervous system disorders, diabetes mellitus, kidney disorders, hepatic disorders, mental impairment disorders, pulmonary disorders, or metabolism and nutritional disorders. Comorbidities based on self-report or review of medical records.

Tips from the consulting room

- Have your research question in mind, as well as a clear idea of what your publication goals are. Think about your ‘story’.

- If you’re planning to publish your work, be sure to review the journal’s “Instructions for authors” and browse recent articles to guide your layout and presentation!

- Consider who will be reading your work and present your findings in a way that’s easy for them to understand.
 - Is it clinicians? Is it industry? Is it other researchers? Is it a broad audience/lay people?
 - Try and make things as readable and accessible as possible.

How to present your results in an accessible way

- Ensure that each figure or table you include can be understood independently, without needing to refer to the main text.
- Don't overload the reader – remember any additional information can be provided in your Appendix/Supplementary Materials and there will be maximum word counts for most journals.
- Group and order your information logically.
- Be consistent in your terminology throughout the manuscript and always provide the units of analysis. E.g. always call it “Intervention group” not “Intervention group” in one part and “Treatment group” in another, or “numerical predictor” in one part and “continuous predictor” in another.
- Consider colourblind friendly colour palettes and ensure high contrast between graph elements (e.g. lines, points).

Best-practice reporting guidelines

- [The Equator Network](#) (Enhancing the QUALity and Transparency Of health Research) is a centralised platform for researchers to access a wide range of reporting guidelines.
 - Seeks to improve the reliability and value of published health research by promoting transparent, standardised and accurate reporting.
- There are guidelines for different study types to help you with your manuscript writing.
 - Provides you with a check-list of information required so that your manuscript can be easily understood by the reader and reproduced by other researchers.

Reporting guidelines for main study types

Randomised trials	CONSORT	Extensions
Observational studies	STROBE	Extensions
Systematic reviews	PRISMA	Extensions
Study protocols	SPIRIT	PRISMA-P
Diagnostic/prognostic studies	STARD	TRIPOD
Case reports	CARE	Extensions
Clinical practice guidelines	AGREE	RIGHT
Qualitative research	SRQR	COREQ
Animal pre-clinical studies	ARRIVE	
Quality improvement studies	SQUIRE	Extensions
Economic evaluations	CHEERS	Extensions

Best-practice reporting guidelines

Key Reasons for Adopting Reporting Guidelines

	STANDARDIZED REPORTING Reporting guidelines provide a standardized framework for documenting and reporting experimental procedures, methods, and results. They ensure consistent capture of essential information.
	ENHANCING REPRODUCIBILITY Complete and transparent reporting enables other researchers to replicate and verify study findings, minimizing ambiguity and increasing reproducibility of results.
	TRANSPARENCY AND TRUSTWORTHINESS Transparent reporting instills confidence , allowing readers to critically evaluate research methodology and identify limitations, biases, or sources of error .
	FACILITATING DATA SHARING AND REUSE Reporting guidelines promote data sharing and facilitate the integration of existing research, accelerating scientific progress and fostering collaboration .
	IMPROVING DATA INTERPRETATION Detailed reporting helps readers accurately interpret and understand presented data by providing essential contextual information and avoiding misinterpretation .
	CONSISTENCY AND COMPARABILITY Reporting guidelines ensure consistency and comparability within a field, aligning experiments with accepted practices and facilitating meta-analyses and literature reviews .
	IDENTIFICATION OF METHODOLOGICAL BIASES Transparent reporting enables identification of biases or methodological flaws that may impact reliability and validity , aiding critical assessment of the study's limitations .
	COMPLIANCE WITH ETHICAL AND REGULATORY STANDARDS Reporting guidelines incorporate ethical and regulatory considerations , ensuring adherence to legal, ethical, and safety obligations in biomedical experimentation.

Best practices for data management and sharing in experimental biomedical research

Statistical analysis plans (SAPs)

THE UNIVERSITY OF
SYDNEY

Statistical Analysis Plan

Study title: Insert study title

Study protocol number: If applicable, insert the study protocol number, ethics approval number or trial registration number.

Investigators: Insert chief investigator's name, company, work address, city, state, postcode, country. Insert names of additional investigators.

Statistical analysis team members: Insert name of the primary person responsible for the statistical analysis, their company, work address, city, state, postcode, country. Insert the names of additional statistical analysts.

Date of plan: Insert date of plan.

Statistical Analysis Plan version: Insert version number, e.g. V1.0 and update in the footer below.

Sydney Informatics Hub: Statistical Analysis Plan Template V1.0

1

- SAPs as well as study protocols are a great tool to improve communication and collaboration between you and other researchers.

- They should include information on:
 - Objectives and hypotheses
 - Primary and secondary outcomes
 - Study design
 - Data collection methods
 - Data management
 - Statistical analysis including handling of missing data and sensitivity analyses
 - Reporting of findings

See our [Experimental Design Workshop](#) resources for a SAP template!

- [Australian Clinical Trials Alliance: Statistical analysis plan](#)
- [Guidelines for the Content of Statistical Analysis Plans in Clinical Trials](#)
- [A template for the authoring of statistical analysis plans](#)
- [Developing a Quantitative Data Analysis Plan for Observational Studies](#)

A cautionary tale...

When inexperience meets bad statistical advice

This is based on a true story from the consulting room highlighting the importance of Research Essentials...

A client approached me for a stats consult with a manuscript due in one week. The whole paper was written, and they just needed confirmation of one results section. The client had relied on a collaborator to analyse the data (who had now left), and they were also under pressure to submit, trusting that the work completed was sound. Whilst sharing their screen and reading through their manuscript and r code, alarm bells started ringing in my head. There were a variety of statistical issues, highlighting a lack of statistical literacy, reproducibility and academic integrity from the collaborator.

A cautionary tale...

When inexperience meets bad statistical advice

Data import & cleaning: Raw REDCap .csv imported directly with no data cleaning prior to analysis.

Outlier handling: Plausible 'outlier' minimum values were removed before analysis, without justification or sensitivity analyses.

Variable coding: Variable types not defined so all predictors were treated as numeric. Categories did not match data dictionary, making interpretation unclear.

Exploratory data analysis: Limited EDA, histograms plotted, but for categorical variables coded as numeric.

Statistical terminology: "Multivariate" incorrectly used instead of "multivariable".

Model specification: Models violated assumptions, had sparse cell counts, and were overly complex and not parsimonious.

Reproducibility: Participant data altered or omitted, and summary tables could not be replicated.

Data management: Files were missing or poorly named in the data folders and multiple result versions were shared with the client.

P-value focus: Heavy reliance on arbitrary p-value thresholds, with little attention to effect size or clinical relevance.

Final advice: Client was advised to include a disclaimer that results should be interpreted with caution as they may be unreliable.

A cautionary tale...

Due diligence matters!

- Even if you are not the primary one analysing the data, if your name is on the paper, then you are also responsible for the academic integrity of the work.
- Many journals now require author contribution statements, making clear who did what, but nonetheless, shared accountability still applies.
- Basic statistical checks (e.g. data types, summary tables and EDA) are often enough to uncover major issues early on and will save you time down the track.
- Don't overlook the simple stuff, as it can catch what complex analysis might obscure.
- *Start simple → get complex.*

A cautionary tale...From the media

Why we removed an article about apple cider vinegar and weight loss

Why we removed an article about apple cider vinegar and weight loss

Published: September 24, 2025 8:40am AEST

The University of Sydney

Open access

Retraction

Retraction: Apple cider vinegar for weight management in lebanese adolescents and young adults with overweight and obesity: a randomised, double-blind, placebo-controlled study

<https://doi.org/10.1136/bmjnph-2023-000823ret>

The paper is being retracted because the authors' analyses could not be replicated and multiple errors were identified. The authors supplied dataset also demonstrated patterns inconsistent with random allocation of participants to treatment groups, improbably small p-values given the limited number of participants included in the study (see [online supplemental material 1](#)).

The authors state that the discrepancies were honest mistakes that arose from version mismatches, data rounding or formatting differences when exporting from statistical software to reporting spreadsheets. However, the authors agree with the decision to retract the work.

Some analysis examples

5. Exploratory data analysis (EDA)

6. Inferential analysis

Data analysis workflow: 4 examples

- **A.** Linear models examples – Simple regression, ANOVA, ANCOVA, Repeated measures.
- **B.** Extended linear models example – Survival analysis.
- **C.** Extended linear models example – Generalised linear model (Binary logistic regression).
- **D.** Multivariate analysis – Confirmatory factor analysis (CFA).

Your variable types will dictate the type of statistical analysis you perform

- **Examples using the generalised linear model framework:**
 - 2-sample t-test = binary explanatory variable and numerical outcome.
 - ANOVA = multi-categorical explanatory variable and numerical outcome.
 - Simple linear regression = numerical explanatory variable and numerical outcome.
 - Binary logistic regression = numerical or categorical explanatory variable and binary outcome.
- For more information on the type of statistical test to run, see the slide entitled “Statistical inferential analysis roadmap” later on in this workshop!

Example A: Linear models examples

Scenario: We are interested in studying a numerical (continuous) outcome variable, e.g. weight gain (kg) or blood cell count (cells/ μ L).

- 1. Simple linear regression – one numerical predictor variable.
- 2. ANOVA (control vs. treatment) – for 2 groups = 2 sample t-test = simple linear regression with one binary predictor variable.
- 3. ANCOVA – ANOVA with a covariate predictor.

For more detail on how to do these analyses including R code, attend our SIH [Linear Models 1: Linear Regression, ANOVA, ANCOVA and Repeated Measures \(a Simple Mixed Model\)](#) workshop!

Example A1: Linear models – Simple linear regression

Step 5: EDA – Plot the data in a scatterplot.

Step 6: Inferential analysis – fit a linear regression line and test if the slope is different from 0; $P < 0.001$; report slope/regression estimate and 95% CI.

Example A2: Linear models – Control vs. treatment experiment

Step 5: EDA – Plot the data with grouped boxplots.

Step 6: Inferential analysis – ANOVA/2-sample t-test; $P < 0.001$; report predicted means and 95% CIs.

Example A3: Linear models – ANCOVA (ANOVA with a numerical covariate)

Step 5: EDA – Plot the data
(differentiate categories of the treatment variable).

Step 6: Inferential analysis – ANCOVA or multivariable regression; $P < 0.001$; report predicted means with or without interaction and 95% CIs.

Supplement has no impact on feed's relationship with weight

Without interaction

Supplement has an impact on feed's relationship with weight

With interaction

Example B: Survival analysis

- **Scenario:** Worcester Heart Attack Community Surveillance Study (WHAS)
- **Aim:** To examine time trends in the incidence rate of acute heart attacks.
- **Objective:** Investigate if different demographic and clinical factors are associated with the time to a heart attack.
- **Data:** Longitudinal, observational data.
- **Outcome:** Heart attack – time to event.
- **Predictors:** Demographic and clinical data.
- **Key feature:** Data is censored – see our Introduction to Survival Analysis WS.

Example B: Survival analysis

Step 5: EDA – Kaplan Meier curve is the EDA plot for survival analysis.

Example B: Survival analysis

Step 6: Inferential analysis – The logrank test to compare the survival curves of two or more groups.

- There is a significant difference in survival between males and females (by log-rank test).
 - Median survival for males: 2160 days [95%CI: not calc].
 - Median survival for females: 1317 days [95% CI 970-1664].

Example C: Binary logistic regression

- **Scenario:** Survey responses of 32 long-term smokers to determine the association between smoking status and lung-cancer diagnosis.
- **Outcome:** Lung cancer (no/yes)
- **Predictors:** Years smoking, BMI
- [Primer on binary logistic regression](#)

For more detail on how to do these analyses including R code, attend our SIH [Linear Models 2: Logistic and Poisson/Count Regression - An Introduction to Generalised Linear Models](#) workshop!

Example C: Binary logistic regression

Step 5: EDA – Log odds of the outcome (lung cancer) vs. numerical predictor (years of smoking) to check the linearity assumption.

Figure 2

Checking the linearity assumption graphically.

Example C: Binary logistic regression

Step 6: Inferential analysis – binary logistic regression to examine association between lung cancer (y/n) and years smoking (numerical), if linearity assumption is met.

For every additional year of smoking, the odds of lung cancer are approximately 1.98 times higher (95% CI 1.36 to 3.86).

Example D: Multivariate analysis – Confirmatory factor analysis

- **Scenario:** To test if a factor model 'SPSS statistical software Anxiety' explains the common variance among 7 questionnaire items:
 1. I dream that Pearson is attacking me with correlation coefficients.
 2. I have little experience with computers.
 3. All computers hate me.
 4. I have never been good at mathematics.
 5. My friends are better at statistics than me.
 6. Computers are useful only for playing games.
 7. I did badly at mathematics at school.

Example D: Multivariate analysis – Confirmatory factor analysis

- **Scenario:** Confirm SPSS Anxiety as a factor explaining the common variance among the 7 items.

Example D: Multivariate analysis – Confirmatory factor analysis

Step 5: EDA – scatter plots + Pearson's correlation coefficient r ; correlation matrix.

Q4	0.40	-0.31	0.40	1			
Q5	0.22	-0.23	0.28	0.26	1		
Q6	0.31	-0.38	0.41	0.34	0.51	1	
Q7	0.33	-0.26	0.35	0.27	0.22	0.30	1

Example D: Multivariate analysis – Confirmatory factor analysis

Step 6: Inferential analysis – to test if a 2-factor model ‘SPSS statistical software Anxiety’ and ‘Attribution bias’ explains the common variance among 7 questionnaire items.

Final notes on Step 6: Inferential analysis

- **We only showed some common examples of statistical analyses – there are many different types of analyses you can consider:**
 - Other Linear Models extensions such as Poisson regression and more complex mixed models - see our SIH [Linear Models 2: Logistic and Poisson/Count Regression - An Introduction to Generalised Linear Models](#) workshop.
 - Survival Analysis for ‘time-to-event’ outcome data – see our SIH [Introduction to Survival Analysis](#) training!
 - Survey Data analysis – see our [Design and Analysis of Surveys 1](#) and [Design and Analysis of Surveys 2: Advanced Topics](#).
 - Other Multivariate Analyses – for example PCA, Factor Analysis - see our [Multivariate Statistical Analysis 1: Dimension Reduction](#).
 - And more [more workshops](#)!

Final notes on Step 6: Inferential analysis

- Start simple and increase complexity step-by-step.
- Always consider/check the test/model assumptions.
- Report 95% CIs for estimates, e.g., predicted means/probabilities/rates.
- For basic analyses consider more powerful (parametric) analyses first and use less powerful tests if assumptions are violated. e.g.:
 - Use a 2-sample t-test with equal or unequal variance for means, before a Mann-Whitney test.
 - Use a chi-squared test to compare proportions before a Fisher's exact test.
- Use knowledge of variable types to guide you through the systematic roadmap on the next slide!

Assumptions of linear model partially or fully unmet?
Use semiparametric or nonparametric.

Final notes on Step 6: Inferential analysis

- **Univariate/univariable**
– involving one variable, e.g. one outcome per analysis; analysis with one predictor variable.
- **Multivariate** – multiple outcomes in the same analysis/model.
- **Multivariable** – multiple explanatory variables in the same analysis/model.
- **Linear models** (LM – numerical outcome).
- **Generalised linear models** (GLM – categorical outcomes, e.g. binary, ordinal, multinomial (for nominal outcome data) or Poisson/negative binomial regression (for count/rate outcome data)).
- **General linear models** (GLM – numerical outcome and any type of explanatory variable (categorical or numerical)).
- **Mixed models** (i.e. LM or GLM with a random effect = LMM or GLMM) where data are clustered in space or time, e.g. repeated measures/longitudinal data.

P-values: Interpretation and reporting beyond $P < 0.05$

*Principles:

- P-values can indicate how incompatible the data are with a specified statistical model.
- P-values do not measure the probability that the studied hypothesis is true, or the probability that the data were produced by random chance alone.
- Scientific conclusions and business or policy decisions should not be based only on whether a p-value passes a specific threshold.
- Proper inference requires full reporting and transparency.
- A p-value, or statistical significance, does not measure the size of an effect or the importance of a result.
- By itself, a p-value does not provide a good measure of evidence regarding a model or hypothesis.

Good reporting practice:

- Avoid making binary conclusions based solely on arbitrary thresholds (e.g., $p < 0.05$ vs $p \geq 0.05$). Statistical evidence should be interpreted on a continuum, not as a simple "significant/non-significant" decision.
- Instead of "*The treatment was statistically significant ($P < 0.05$)*"; you should report: "*Participants receiving the treatment scored 4.2 points higher on average (95% CI 1.3, 7.1; $P = 0.008$)*."
- You should include:
 - Effect size (magnitude of the effect)
 - Confidence intervals (precision of the estimate)
 - Exact p-value (where possible)
 - Practical, clinical or scientific significance
 - Study limitations and uncertainty

Further R resources

- There is a large online community of R users contributing to free ‘packages’ with data analysis functions, which leads to many ways of coding your analysis in R. This can be confusing. We recommend using tidyverse packages and tidy-centric code.
- See our SIH helpful links for guides on using [R and Rstudio](#).
- [LinkedIn Learning: R courses](#)
 - Including [Learning the R Tidyverse \(2024\)](#), [Complete Guide to R: Wrangling, Visualizing, and Modelling Data](#), and [Cleaning Bad Data in R](#).
- [RLadiesSydney: RYouWithMe](#)

Or send us an email:
sih.info@sydney.edu.au

How to use our workshops

- Workshops developed by the Statistical Consulting Team within the Sydney Informatics Hub form an integrated modular framework. Researchers are encouraged to choose modules to **create custom programs tailored to their specific needs**. This is achieved through:
 - Short 90-minute workshops, acknowledging researchers rarely have time for long multi day workshops.
 - Providing statistical workflows applicable in any software, that give practical step by step instructions which researchers return to when analysing and interpreting their data or designing their study e.g. workflows for designing studies for strong causal inference, model diagnostics, interpretation and presentation of results.
 - Each one focusing on a specific statistical method while also integrating and referencing the others to give a holistic understanding of how data can be transformed into knowledge from a statistical perspective from hypothesis generation to publication.

For other workshops that fit into this integrated framework, refer to our training link page under statistics, found below:

We recommend our experimental design and sample size workshops

Experimental design workshop

- Far too many researchers think they know all they need to in this area. We commonly see designs that could be substantially improved for stronger causal inference and improved results which leads to publication in higher impact journals (amongst other benefits).
- Even if you have already collected your data, it is well worth attending since it may improve your write up and analysis. E.g., we had a client who didn't realise they had a very strong before/after control/impact (BACI) design.

Power and sample size workshop

- Shows the steps and decisions researchers need to make when designing an experiments to ensure sufficient sample e.g., power, minimum sample required to fit the necessary model, etc.
- Also, how much power the study has, i.e., does it have sufficient power to detect the effects you expect to see, or is your study a complete waste of time and resources?

A reminder: Acknowledging SIH

- All University of Sydney resources are available to researchers free of charge.
- The use of the SIH services including the Artemis HPC and associated support and training warrants acknowledgement in any publications, conference proceedings or posters describing work facilitated by these services.
- The continued acknowledgment of the use of SIH facilities ensures the sustainability of our services.

Suggested wording for use of workshops and workflows:

- *“The authors acknowledge the Statistical workshops and workflows provided by the Sydney Informatics Hub, a Core Research Facility of the University of Sydney.”*

We value your feedback

- We want to hear about you and whether this workshop has helped you in your research. What worked and what didn't work.
- We actively use the feedback to improve our workshops.
- Completing this survey really does help us and we would appreciate your help! It only takes a few minutes to complete (promise!)
- You will receive a link to the anonymous survey by email.
